

OSTEOPOROSIS

Offer your patients the least invasive option first,  
with an interventional radiologist as your partner  
in patient care.

There is a new option for your osteoporosis patients who live with the pain and lifestyle restrictions caused by spinal fractures. Since 1994, a nonsurgical, outpatient procedure called vertebroplasty has brought relief — often within hours of treatment. This minimally invasive, image-guided treatment stabilizes the collapsed vertebra with an injection of medical grade bone cement into the spine.

Performed as an outpatient procedure under conscious sedation, vertebroplasty is indicated for your patients who have failed conventional medical pain management. Vertebroplasty offers sustained long-term pain relief and improved range of motion in more than 90% of patients, with a low complication rate.

VERTEBROPLASTY

Today, interventional radiology treatments have become first-line care for a wide variety of conditions. No other partner offers you multimodality state-of-the-art imaging and diagnostic expertise, coupled with an unparalleled clinical experience across specialties, and in-depth knowledge of the least invasive treatments.

For more information about vertebroplasty, or to find an interventional radiologist in your area, visit the referring specialists section at [www.SIRweb.org](http://www.SIRweb.org).
