

## Interventional Radiologists are tough on cancer. Kind on patients.

Advances in interventional radiology make it possible to kill tumor cells without harming the surrounding tissue. Two procedures, tumor ablation and chemoembolization, offer hope for patients whose tumors are inoperable. Using their skill in imaging to guide a needle through the skin and into the tumor, Interventional Radiologists apply heat to kill the tumor. These doctors also deliver a high dose of cancer-killing drug directly to the site while depriving the tumor of its blood supply. Tumor ablation and chemoembolization are just two of many minimally invasive, targeted treatments offered by Interventional Radiologists.

Know your options. Today you have nonsurgical choices and direct access to these specialists. Visit [www.SIRweb.org](http://www.SIRweb.org) for more information or a directory of Interventional Radiologists in your area.
