

Interventional Radiologists are making giant strides for DVT patients.

A painful blood clot in the leg, known as deep vein thrombosis, can occur without warning. Unfortunately, blood thinners can't dissolve it, and left untreated, the clot may damage the leg and cause permanent disability. Using their skill in imaging to guide clot-busting drugs directly to the site, Interventional Radiologists clear the clot and prevent disability. This minimally invasive, targeted treatment, known as catheter-directed thrombolysis, is just one of many advances in medicine pioneered by Interventional Radiologists.
